The ROSENBAUER hose roll-up device is a great help when reeling in extended fire brigade hoses at the scene of emergencies or during exercises. It is suitable for B- and C-hoses with a max. length of 20 m and can wind up the hose in either a single or doubled roll. The device has a weight of approx. 9.5 kg and compact dimensions of 1,300 x 410 mm or 730 x 410 mm folded up, it is easy to handle and store away.

**Instruction for use**

1. Pull out the spring bolt and the telescopic grip until the bolt relocks. Then set the track width using the wing screw (approx. 5 mm wider than the hose).

2. Attach the end of the hose to the forked head using the coupling, or in case of double rolled hoses, by means of a loop in the hose.

3. Simply reel in the hose until the coupling is directly in front of the axle of the roller.

4. Tip the roller onto its side and remove the rolled up hose from the fork.
